

Loads every script except for those in the intrusive category.

```
nmap --script "not intrusive"
```

This is functionally equivalent to `nmap --script "default,safe"`. It loads all scripts that are in the default category or the safe category or both.

```
nmap --script "default or safe"
```

Loads those scripts that are in both the default and safe categories.

```
nmap --script "default and safe"
```

Loads scripts in the default, safe, or intrusive categories, except for those whose names start with `http-`.

```
nmap --script "(default or safe or intrusive) and not http-"
```

Names in a Boolean expression may be a category, a filename from `script.db`, or `all`. A name is any sequence of characters not containing `'`, `''`, `'('`, `')`, or `;;`, except for the sequences `and`, `or`, and `not`, which are operators.
